There are two n-element arrays of integers, A and B. Permute them into some A' and B' such that the relation $A'[i] + B'[i] \geq k$ holds for all i where $0 \leq i < n$.

There will be q queries consisting of A, B, and k. For each query, return YES if some permutation A', B' satisfying the relation exists. Otherwise, return NO.

Example

$A = [0, 1]$

$B = [0, 2]$

$k = 1$

A valid A', B' is $A' = [1, 0]$ and $B' = [0, 2]$: $1 + 0 \geq 1$ and $0 + 2 \geq 1$. Return YES.

Function Description

Complete the twoArrays function in the editor below. It should return a string, either YES or NO.

twoArrays has the following parameter(s):

- int k: an integer
- int A[n]: an array of integers
- int B[n]: an array of integers

Returns

- string: either YES or NO

Input Format

The first line contains an integer q, the number of queries.

The next q sets of 3 lines are as follows:

- The first line contains two space-separated integers n and k, the size of both arrays A and B, and the relation variable.
- The second line contains n space-separated integers $A[i]$.
- The third line contains n space-separated integers $B[i]$.

Constraints

- $1 \leq q \leq 10$
- $1 \leq n \leq 1000$
- $1 \leq k \leq 10^9$
- $0 \leq A[i], B[i] \leq 10^9$

Sample Input

```
STDIN       Function
-----       --------
2           q = 2
3 10        A[] and B[] size n = 3, k = 10
2 1 3       A = [2, 1, 3]
7 8 9       B = [7, 8, 9]
4 5         A[] and B[] size n = 4, k = 5
1 2 2 1     A = [1, 2, 2, 1]
3 3 3 4     B = [3, 3, 3, 4]
```

Sample Output

```
YES
NO
```

Explanation

There are two queries:

1. Permute these into $A' = [1, 2, 3]$ and $B' = [9, 8, 7]$ so that the following statements are true:
   - $A[0] + B[1] = 1 + 9 = 10 \geq k$
   - $A[1] + B[1] = 2 + 8 = 10 \geq k$
   - $A[2] + B[2] = 3 + 7 = 10 \geq k$
2. $A = [1, 2, 2, 1]$, $B = [3, 3, 3, 4]$, and $k = 5$. To permute A and B into a valid A' and B', there must be at least three numbers in A that are greater than 1.

#
# Complete the 'twoArrays' function below.
#
# The function is expected to return a STRING.
# The function accepts following parameters:
#  1. INTEGER k
#  2. INTEGER_ARRAY A
#  3. INTEGER_ARRAY B
#

def twoArrays(k, A, B):
    # Write your code here
    A.sort()
    B.sort(reverse=True)
    for idx in range(len(A)):
        if A[idx] + B[idx] < k:
            return 'NO'
    return 'YES'

if __name__ == '__main__': …
```
