Note: This challenge is  $10^{-4} \text{ are acceptable.}$ **Note:** This challenge introduces precision problems. The test cases are scaled to six decimal places, though answers with absolute error of up to

### **Example**

$$arr = [1, 1, 0, -1, -1]$$

There are n=5 elements, two positive, two negative and one zero. Their ratios are  $\frac{2}{5}=0.400000$ ,  $\frac{2}{5}=0.400000$  and  $\frac{1}{5}=0.200000$ . Results are printed as:

0.400000 0.400000 0.200000

# **Function Description**

Complete the plusMinus function in the editor below.

plusMinus has the following parameter(s):

• int arr[n]: an array of integers

Print

Print the ratios of positive, negative and zero values in the array. Each value should be printed on a separate line with 6 digits after the decimal. The function should not return a value.

# **Input Format**

The first line contains an integer, n, the size of the array.

The second line contains n space-separated integers that describe arr[n].

## Constraints

 $0 < n \le 100$ 

 $-100 \le arr[i] \le 100$ 

# **Output Format**

**Print** the following **3** lines, each to **6** decimals:

1. proportion of positive values

2. proportion of negative values

3. proportion of zeros

# Sample Input

```
STDIN
            Function
           arr[] size n = 6
-43-9041 arr = [-4, 3, -9, 0, 4, 1]
```

### **Sample Output**

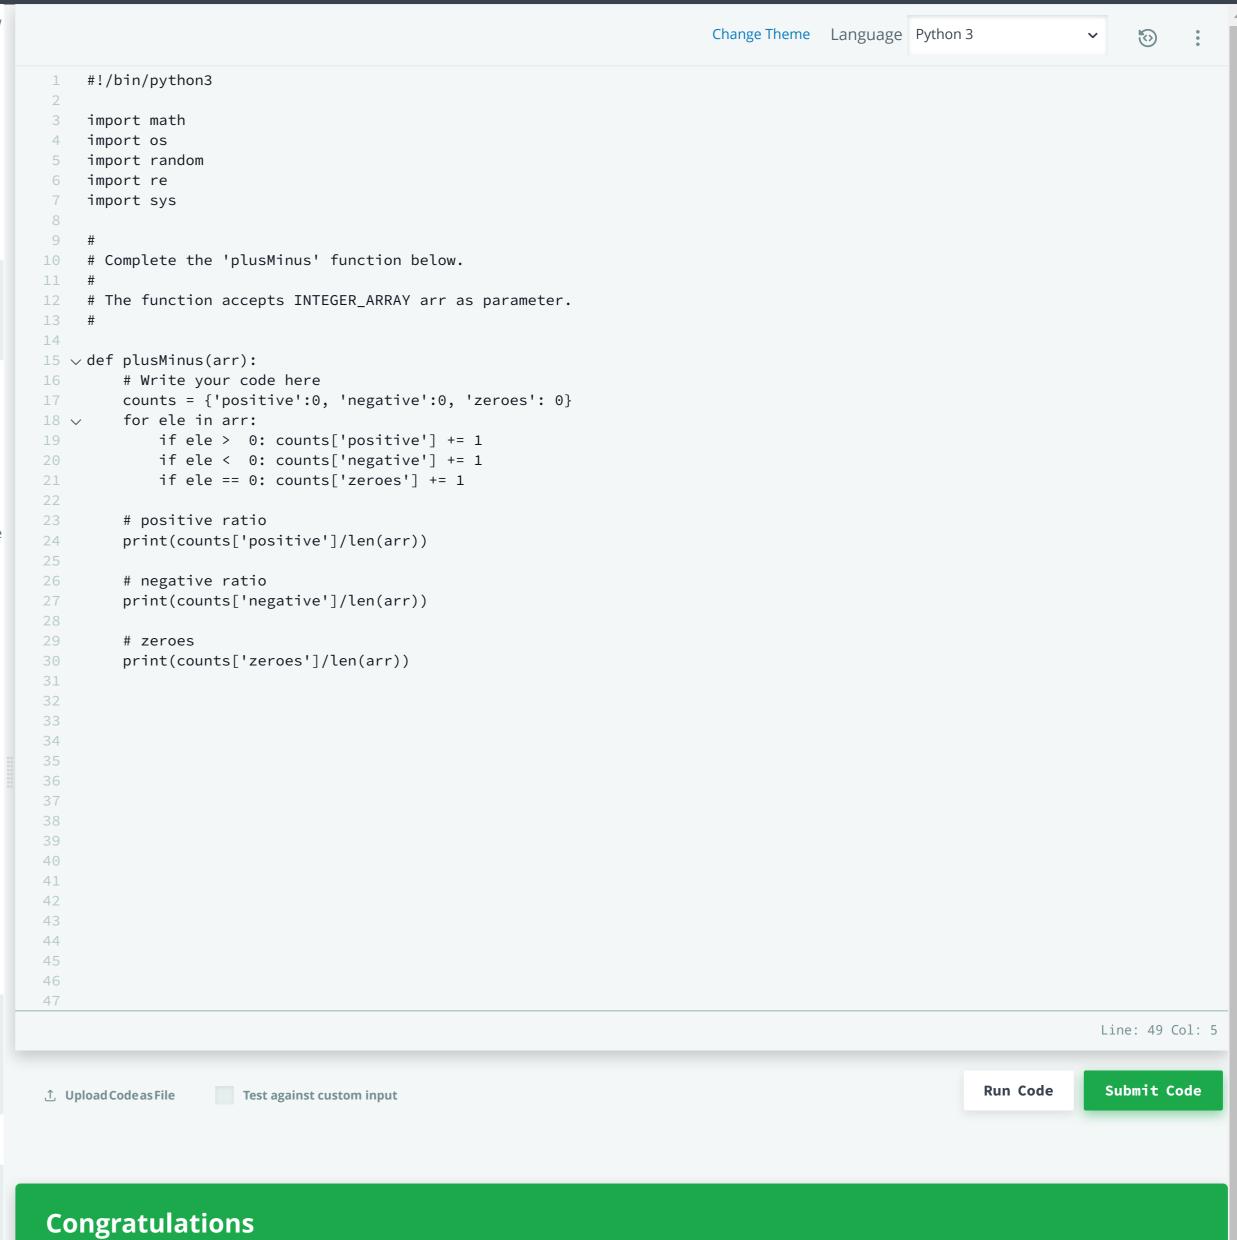

0.500000

0.333333 0.166667

### Explanation

There are  ${\bf 3}$  positive numbers,  ${\bf 2}$  negative numbers, and  ${\bf 1}$  zero in the array.

The proportions of occurrence are positive:  $\frac{3}{6} = 0.500000$ , negative:  $\frac{2}{6} = 0.333333$  and zeros:  $\frac{1}{6} = 0.166667$ .
